**Abstract:** This study based on the Terellinae (Diptera: Tephritidae) material collected in Kahramanmaraş province of Turkey in years 2009 and 2010. Twelve species [*Chaetorellia carthami* Stackelberg, *C. loricata* (Rondani), *C. succinea* (Costa), *Chaetostomella cylindrica* (Robineau-Desvoidy), *Terellia ceratocera* Hendel, *T. fuscicornis* (Loew, 1844), *T. gynaecochroma* (Hering), *T. nigripalpis* Hendel, 1927, *T. quadratula* (Loew, 1869), *T. ruficauda* (Fabricius, 1794), *T. serratulae* (Linneaus) and *Terellia virens* (Loew)] of Terellinae were identified in the study region. The figures of wing patterns of each species are given. The zoogeographical distribution of the species is included.

## Introduction

The fruit flies (Tephritidae) are one of the families of the Acalyptrate Diptera, numbering over 4300 valid species worldwide (Norrbom 2004). Many species of fruit flies, especially the subfamily Tephritinae, develop in plants of the family Asteraceae (Freidberg and Kugler 1989). Ninety-four species of fruit flies were reported in Turkey by Kütük (2003a). In addition, *Terellia yukseli* Kütük (2009b) were described from Turkey. Kütük and Özgür (2003b), *Terellia quadratula* (Loew), *T. ceratocera* (Hendel), *T. lappae* (Cederhjel), *T. ruficauda* (Fabricius), *T. winthemi* (Meigen), Özgür and Kütük (2003), *Terellia rhabontici*, Kütük and Varol (2006), *Terellia gynaecochroma* (Hering 1937), *T. luteola* (Wiedemann 1830) have also been recorded in Turkey.

## Materials and Method

Adult specimens were collected using an insect net from the host plant in various locations in province of Kahramanmaraş in Turkey, during 2009 and 2010. These specimens are deposited at the insect museum of Gaziantep University, Department of Biology. Species were identified using the keys by Hendel (1927), White (1988), Freidberg and Kugler (1989), Merz (1994), Korneyev and White (2000) and Kütük (2003a). The terminology follows primarily White et al (2000).
